

Agentic AI

The AI Revolution Starts Here

Topics at a Glance

01 What is AI?

03 AI as the Operating Layer

05 Smart Tool → Smart Worker

07 Your Personal AI Delegate

09 7 Golden Rules (Invariants)

02 What is Agentic AI?

04 The 10-80-10 Rhythm

06 The Agent Factory

08 7 Principles of Problem Solving

10 Real Example: Ecomm Mart

01 — What is AI?

Artificial

Made by humans — software that learns from data

Intelligence

Ability to recognize patterns and make decisions

Not magic

It is math, data, and programming — already in daily life

02 — What is Agentic AI?

L1

Predictive AI

Gives one prediction
(spam filter, recommendation)

L2

Generative AI

Chats & creates content,
still waits for your instruction

L3

Agentic AI ★

Gets a GOAL and does
the entire job on its own

4 Abilities That Make AI 'Agentic'

- Planning — breaks goals into steps
- Tool Use — browses web, writes code, sends messages
- Self-Correction — notices mistakes and fixes them
- Goal Completion — works until the entire job is done

03 — AI as the Operating Layer

WHAT DIES

- SaaS apps as destinations
- Graphical shell as your workspace
- Humans as machine operators
- UI-driven workflows

WHAT SURVIVES

- OS becomes invisible plumbing
- Capabilities survive as API calls
- Human as source of intent
- Judgment — what to want

Old: Humans use apps → New: Humans delegate work through agents

04 — The 10-80-10 Rhythm

10%
Human sets
direction

80% — AI does the work

10%
Human checks
& approves

Intent

Knowing what
you want to achieve

Verification

Checking if the
work is correct

Ownership

Being responsible
for the final result

05 — From Smart Tool to Smart Worker

AI as a TOOL

- You hold it, you do the work
- You control every single step
- Tool speeds up one part only
- You still do the full job

AI as a WORKER

- You give the goal, it does the work
- AI handles the entire task
- You only review the result
- You pay for finished results — not access

Mode 1 — Problem-solving: use AI now to solve today's task

Mode 2 — Manufacturing: use AI to build a worker that runs forever

06 — The Agent Factory

A repeatable process for building AI workers — not a product you buy.

Result: An AI-Native Company — where most workers are AI, humans set direction & verify results.

07 — Your Personal AI Delegate

EDGE LAYER

You → Your Personal Delegate

Knows your preferences • carries your authority •
manages all workers

AI WORKFORCE LAYER

Support Worker

Finance Worker

Sales Worker

Legal Worker

You never manage 20 workers directly — your ONE delegate handles them all for you.

08 — 7 Principles of Agent Problem Solving

P1

Bash is the Key — Action over talk — the agent has hands, not just a mouth

P2

Code as Interface — Specify the shape before the content (structure first)

P3

Verification — "Looks right" is the precise failure mode — always verify

P4

Decomposition — Small reversible steps — each cheap to undo

P5

Persistence — Files are memory — the chat is volatile, filesystem isn't

P6

Constraints & Safety — Scope what the agent is allowed to touch

P7

Observability — See what the agent did, when, and why

09 — 7 Golden Rules of an AI-Native Company

- 1 Human is always in charge — every action traces back to a human
- 2 Every human gets a delegate — you can't manage 20 workers by hand
- 3 Workforce needs a management layer — hire, assign, and fire AI workers
- 4 Each worker uses the right engine — important work = reliable model
- 5 Every worker uses a system of record — the single source of truth
- 6 Workforce can grow under rules — automatically, within human-set limits
- 7 Company runs on a nervous system — work flows automatically between workers

10 — Real Example: Ecomm Mart Support Worker

1	Write Clear Instructions	Goal: read tickets, classify, write replies, escalate hard cases. Budget: \$200/month max.
2	Connect to Records	Link to Shopify orders & customer database so AI looks up real data.
3	Give It Skills	Teach it: how to write replies, classify tickets, when to escalate.
4	Set Guardrails	Budget cap, approval for big refunds, audit trail — AI CANNOT exceed limits.
5	Test, Then Deploy	Run on 100 old tickets first. Fix issues. Only then go live.

Result: Works 24/7 · Handles 80% tickets automatically · Within budget · Humans handle complex cases

Big Ideas — In One Breath

1. AI is software that learns and makes decisions on its own.
2. Agentic AI plans, uses tools, and completes entire jobs without step-by-step guidance.
3. The Agent Factory is how you build AI workers and run an AI-Native Company.
4. **You are promoted — not replaced. From worker to director.**
5. Future belongs to those who can direct AI, connect it to data, and verify results.
